Why should you secure your home and home network?

Does a sense of security mean much to you? If so, my home and home network security system is exactly what you are looking for!

If you consider yourself somewhat of a tech savvy person, or just want to learn, this security system is the perfect project for you. This system will provide a cost-efficient home security camera, a firewall to protect your home network, and an external hard drive to easily store data on your secure network.

With a budget of around $150 dollars and a little hard work, you can implement this system yourself to start protecting your home and home network!

How does this system work?

- A dedicated PC with the Untangle Firewall software will protect your home network from intrusion
- A 2TB external hard drive attached a home router will provide storage for all your files and security footage.
- A Raspberry Pi Model B+ will act as a surveillance camera. All recorded footage will be stored on the external hard drive.
